The use of compression hosiery in mixed aetiology ulceration and palliative care

Helen Butterfield

The UK has an expanding elderly population, which means that in the future nurses will need to learn how to work in community-based units, such as nursing homes and hospices, will increasingly encounter age-related problems, and patients suffering from palliative care and ulceration. This article looks at an innovative approach that has zips. Manufacturers have developed a number of hosiery styles to make application easier, including inner and outer layers, and products that have zips.

This article looks at an innovative product that is not only easy to apply, making well-care more likely, but also mild compression, which is not only easy to apply, but also mild compression in venous leg ulcers. It is crucial that community clinicians understand the mechanical element of compression therapy, where patients may find it difficult to adhere to long-term treatment due to the commitment involved in bandaging regimens, as well as to the correct equipment and knowledge, but that they also have access to the correct equipment in a format that is cosmetically acceptable to patients. Compression hosiery can have beneficial effects.

Compression therapy is a simple principle that, if applied correctly, can have beneficial effects.

Cool feet
Poor toenail growth
Ulcers (a ‘punched-out’
effect on quality of life (Persoon et
al., 2010). It is not true that healing a leg ulcer is only the first stage in their treatment, although it is a long-term management plan, including compression, an accurate rates (Anderson, 2013).

Artificial problems arise when the flow of blood through the arteries is impaired. The main cause is build-up of fatty deposits (atheroma) on the plaques inside the artery walls, narrowing the flow of blood (Anderson and King, 2006), as there is low pressure exerted at rest, but high pressures on exercise (Stevens, 2002).

Chronic arterial disease
Ranges vary (Anderson, 2013). However, applying reduced compression can have benefits. The aim of reduced compression is to achieve a balance between safety and efficacy.

The appearance of compression bandaging is often related to the patient’s quality of life, as it allows an easier way of managing symptoms. For example, compression bandaging is often used by patients for palliative care patients. In this case, compression bandaging is used to improve the quality of life of patients who are suffering from incurable diseases, such as cancer. Compression bandaging can help to control oedema by applying light compression, which can help to maintain the skin’s integrity by increasing the rate of healing and reducing the risk of infection. Compression bandaging can also help with muscle strength and tone and improve freedom of movement, as it can help to control oedema at the end of life (WHO, 2010). Compression bandaging can also help with muscle strength and tone and improve freedom of movement, as it can help to control oedema at the end of life (WHO, 2010).

Compression bandaging is also used to improve the look and feel of compression hosiery. It is a method, so clinicians can easily help with muscle strength and tone and improve freedom of movement, as it can help to control oedema at the end of life (WHO, 2010). Compression bandaging can also help with muscle strength and tone and improve freedom of movement, as it can help to control oedema at the end of life (WHO, 2010).

Sox compression is usually recommended for patients with mixed aetiology ulcers, as they can also involve diabetes, particularly hard to heal.

Symptoms of arterial disease include:

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claudication</td>
<td>Pain or discomfort in the leg on walking or during exercise</td>
</tr>
<tr>
<td>Rest pain</td>
<td>Pain at rest that is not relieved by activity</td>
</tr>
<tr>
<td>Ulcers</td>
<td>Open sores or wounds appearing on the skin</td>
</tr>
<tr>
<td>Skin changes</td>
<td>Changes in the color, texture, or temperature of the skin</td>
</tr>
<tr>
<td>Pallor</td>
<td>Pale skin color</td>
</tr>
<tr>
<td>Coolness</td>
<td>Cold skin</td>
</tr>
<tr>
<td>Hair loss</td>
<td>Decreased hair growth</td>
</tr>
</tbody>
</table>

Table 1: Symptoms of arterial disease

The appearance of compression bandaging is also an issue for older people, and it can be dangerous, impeding blood flow and potentially resulting in damage to the peripheral nervous system (Stevens and Vowden, 2010). Therefore, compression bandaging should be carefully monitored by an experienced clinician.

In conclusion, applying compression bandaging can help to achieve a balance between safety and efficacy. The appearance of compression bandaging is often related to the patient’s quality of life, as it allows an easier way of managing symptoms. For example, compression bandaging is often used by patients for palliative care patients. In this case, compression bandaging is used to improve the quality of life of patients who are suffering from incurable diseases, such as cancer.
